Bacteriol. 184:2005-2018(2002).

1. FUNCTION: The UvrABC repair system catalyzes the recognition and processing of DNA lesions. A damage recognition complex composed of 2 uvrA and 2 uvrB subunits scans DNA for abnormalities. Upon binding of the uvrA(2)B(2) complex to a putative damaged site, the DNA wraps around one uvrB monomer. DNA wrap is dependent on ATP binding by uvrB and probably causes local melting of the DNA helix, facilitating insertion of uvrB beta-hairpin between the DNA strands. Then uvrB probes one DNA strand for the presence of a lesion. If a lesion is found the uvrA subunits dissociate and the second uvrB binding the uvrA subunits dissociate and the second uvrB subsequently bound by uvrC and the uvrA subunits dissociate and the second uvrB subsequently by uvrC and the second uvrB menticial or the presence of a lesion. If a lesion of the uvrA subunits dissociate and the second uvrB subsequently by uvrC and the second uvrB menticial or the presence of a lesion. If a lesion of the uvrA subunits dissociate and the second uvrB subsequently by uvrC and the second uvrB menticial or the presence of a lesion is found the second uvrB menticial or the presence of a lesion is found the acconductor or the presence of a lesion is found the acconductor or the presence of a lesion is found the acconductor or the presence of a lesion is found the acconductor or the presence of a lesion is found the acconductor or the presence of a lesion is found the acconductor or the presence of a lesion is found the acconductor

"Evidence for lateral gene transfer between Archaea and Bacteria from "evidence of Thermotoga maritima.";

"Genome sequence of Thermotoga maritima.";

Nature 399:323-329(1999).

-I FUNCTION: This protein is involved in the repair of mismatches in DNA. It is possible that it carries out the mismatch recognition step. This protein has a weak AfPase activity (By similarity).

-I SIMILARITY: Belongs to the DNA mismatch repair muts family.
                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DOMENTY: TH.1 binds directly to anionic phospholipid membranes; myosins I could therefore move actin relative to membranes and vice versa. TH.2 and SH3 bind tightly to F-actin; this together with the nucleotide-sensitive site in the head, allows single molecules of myosin I to cross-link actin filaments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   myosin I heavy

CDP-diacylalycerol--glycerol-3-phosphate 3-phosphatidyltransferase
(EC 2.7.8.5) (Phosphatidylglycerophosphate synthase) (PGP synthase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -1- FUNCTION: This protein catalyzes the committed step to the synthesis of the acidic phospholipids (By similarity).
-1- CATALYTIC ACTIVITY: CDP-diacy101ycerol + glycerol 3-phosphate -CMP + 3-(3-phosphatidyl)-glycerol 1-phosphate.
-1- PATHMAY: Acidic phospholipids biosynthesis.
-1- SUBCELLULAR LOCATION: Integral membrane protein (By similarity)
-1- SIMILARITY: Belongs to the CDP-alcohol phosphatidyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -i. FUNCTION: Ribonucleoprotein DNA polymerase that catalyzes the denote synthesis of telomeric simple sequence repeats. P80 binds tightly and specifically to the telomerase RNA suggesting its association with a region of RNA secondary structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tetrahymena thermophila.

                                     processing of DNA lesions. A damage recognition complex composed of 2 uvrA and 2 uvrB subunits scans DNA for abnormalities. Upon binding of the uvrA(2)B(2) complex to a gutative damaged site, the DNA wraps around one uvrB monomer. DNA wrap is dependent on ATP binding by uvrB and probably causes local melting of the DNA helix, facilitating insertion of uvrB beta-hairpin between the DNA strands. Then uvrB probes one DNA strand for the presence of a lesion. If a lesion is found the uvrA subunits dissociate and the uvrB-DNA preincision complex is formed. This complex is subsequently bound by uvrC and the second uvrB subunit that will check the other stand for damage (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                    UVTABC system protein B (UVTB protein)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: Catalyzes the formation of the alpha-1,6-glucosidic linkages in glycogen by scission of a 1,4-alpha-linked oligosaccharide from growing alpha-1,4-glucan chains and the subsequent attachment of the oligosaccharide to the alpha-1,6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PATHWAY: Starch biosynthesis; third step.
SUBUNIT: Monomer.
SUBCELLULAR LOCATION: Chloroplast; amyloplast.
SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                position.
CATALYTIC ACTIVITY: Formation of 1,6-glucosidic linkages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    starch

XX The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HFL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region

                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIG176-ABIG1751), expressed DNA sequences (ABIG1840-ABIG1815) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directlem wiffor at ftp.wipo.int/pub/published_pct_sequences

The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HFL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL06176-ABL30511), expressed DNA sequences (ABL061840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Considing a polypeptide whose expression is inhibited by the antisense concloing a polypeptide whose expression is inhibited by the antisense concloid acid; (2) a host cell containing the vector; (3) an isolated containing the vector; (3) an isolated control of the polypeptide or its fragment whose expression is inhibited by the control of the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular control or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for control or proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or agene on which the test compound that inhibits proliferation; (8) compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the gene conduct is overexpressed or underexpressed; (12) determining the extent conduct is overexpressed or underexpressed; (12) determining the extent conduct is overexpressed or underexpressed; (12) determining the extent conduct is overexpressed or underexpressed; (13) dentifying the target of a compound that inhibits the gene conduct is overexpressed or conduct is calds are useful for strains; or (13) identifying the target of a compound that inhibits the conduct is conducted acids are useful for clambility and conduct is an inhibit and conduct is conducted acids are useful for clambility and conducted acids are useful for conduct is conducted acids are useful for conductive definitions. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this conductive of the printed specification, but was obtained conductive format directly from WIPO at

The cDNA clone AAR00052, which encodes the proteins AAR82066-71 (the 6 possible reading frames), was rescued from the lambda phage, searched against a sequence database and found to be unique HGBV sequence. Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine t prevent HGBV infection. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describe a method for detecting target hepatitis GB virus (HGBV) nucleic acid (THN) in a test sample (T) suspected of containing HGBV. The method involves reacting (T) with a HGBV polynuclectide probe (I) containing 15 contiguous nuclectides, and which selectively hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of target HGBV. The method is used for detecting target HGBV nucleic acid in the test sample suspected of containing HGBV and for characterisation of newly ascertained etiological agent of non-A, non-B, non-C, non-D and non-E hepatitis causing agents collectively tremed as hepatitis GB virus.

AAA55270 to AAA55489 and AAB08985 to AAB09480 represent nucleotide and protein sequences used in the exemplification of the present invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting suspected

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a Staphylococcus aureus protein of unknown function, and is encoded by a DNA sequence of the invention. The DNA sequences were isolated from Staphylococcus aureus WCHU29 (NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response by Antagonists of the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, central nervous, especially respiratory, cardiac, bonces and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 1998-252940/23.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ä
```

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis, and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cepidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to CAAH55090 represent specifically claimed S. epidermidis genomic DNA coplynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. N.B. The present invention consecutions all the polynucleotide sequences given in the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present volume.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

This invention relates to nitrilases and the nucleic acids that encethese enzymes thereof. Specifically, it refers to polypeptides that exhibit nitrilase activity, i.e. the ability to directly hydrolyse nitriles or cyanohyrdins into their corresponding carboxylic acids:

The present invention relates to the isolation of novel mammalian and CC human reproductive-specific proteins (AMU07859-AMU07899), and the nucleic acids encoding them. The nucleic acids encoding reproductive-specific CC contesins are useful for diagnosing infertility which is a result of CC reduced sperm count, reduced sperm motility, malformed sperm or CC combinations of these. The sequences of the invention are useful as CC markers for spermatogonial cells, for identifying genes or proteins CC characteristic of male infertility, diagnosing or aiding in the diagnosis CC characteristic of male infertility, diagnosing or aiding in the diagnosis CC of infertility in men, and for contraception in which sperm production or sperm count is reduced or defective sperm is produced. Antibodies to CC these proteins in a sample obtained from a man being assessed for these proteins in a sample obtained from a man being assessed for contracepticity, for identifying the expression of genes in particular cell type or particular developmental stage, for studies of spermatogenesis, and for immunofluorescence of germ cells or in Western blots for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

Furthermore, the present invention describes isolated from mesophilic microorganisms, that have improved activity and stability at increased pH and temperature. They are also inexpensive, efficient catalysts, have broad substrate specificity and are capable of chiral differentiation. This polypeptide is a protein sequence that exhibits nitrilase activity of the invention.

assessing the presence of the protein the antibody binds. The sequences of the invention are also useful for treating disorders of reduced sperm count, and for increasing sperm count and/or sperm activity. The nucleic acids of the invention are useful in gene therapy. AAU07859-AAU07882 represent the mammalian reproduction-specific proteins of the present

                                                                                                                                                                                                                                                     The Thermotoga maritima thermostable protein, MutS (AAW01602), binds specifically to bulge loops in a heteroduplex nucleic acid. Recombinant MutS can be produced in transformed host cells using an isolated gene sequence (AAT58228). MutS proteins (see also AAW01601) are useful in methods for reducing DNA misincorporation in amplification reactions such as PCR and LCR, in methods for detecting and amplifying nucleic acids contg. specific sequences, and in methods for selecting against a nucleic acid comprising a specific sequence. These methods enable detection of partic. sequences associated with infectious diseases, genetic disorders or cellular disorders such as cancer, e.g. oncogenes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thermostable protein, MutS, and corresponding coding amplification methods to detect particular sequences genetic diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MusS; thermostable protein; bulge loop; heteroduplex; amplification; polymerase chain reaction; PCR; ligase chain reaction; LCR; mutation;

                                                                                                                                             CC Synthetically produced proteins and peptides, characterised in that the CC AA sequence is derived from the primary nucleotide sequence of HIV-2 CSBL/ISY or a part thereof, or a degenerate thereof are claimed. HIV-2 CC SBL/ISY represents the complete genome of the virus SBL-6699 (=SBL-6699-685). The proviral DNA was obtd. from a genomic library constructed from CC DNA of HUT-78 cells infected with SBL-669-85 using the lambda-phage vector EMBL-3. SBL-669-85 was isolated from lymphocytes of a West CC African woman. Protection is requested for the entire genome disclosed in CC n80890 and for parts thereof, and corresp. to various genes such as the CC gag gene (corresp. to nucleotides 547 to 2105), the pol gene (nucleotides 547 to 2105), the pol gene (nucleotides 61827-4931) and the env gene (nucleotides 6144 to 8682), the corresp. AC Sequences and parts thereof and various products derived therefrom, or use thereof, such as clones prepd. by recombinant vector method, HIV test CC devices and methods. X corresponds to the translation of a stop codon.
                                                                      Query Match

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      - protein search, using sw model
